

City Districts 1 - 7 Linear Regression Analysis

Exploring Variable Impact on Sale Price | 2023 - 2025 Sales

Elliot Dean - Program Analyst IV
Office of the Chief Financial Officer | Office of the Assessor
City of Detroit

19 May 2026

Results Summary

The standardized beta metric is a unitless measure of the relationship between an independent and dependent variable based on standard deviation (SD). The value of beta indicates that for every increase in standard deviation of a predictor, the target will change by the equivalent amount.

The average values obtained by the backward linear regression runs in R suggest that the following predictors have a higher likelihood of impacting sale price:

- Sale month (predominantly first half of the year) | - Size
- Age | - Condition / Quality
- Exterior Siding Type | - Restrooms
- Central Air Conditioning

In addition, a number of Economic Condition Factors were significantly correlated with sale price. As these were District specific, they are reported after the shared predictors.

* All figures represent models trained using ECFs (formulas 3 -> 6)

Results Excluding Economic Condition Factors

LN_SPPSF Models – Standardized Beta Values
